Achievements unlocked

Solution Availability

The fluctuation in database response time causes inconsistent business performance

Continual innovations built into Ai-DBA, giving you higher level of stability in business performance

Why Ai-DBA?

You can perform as good as an expert DBA by few clicks.

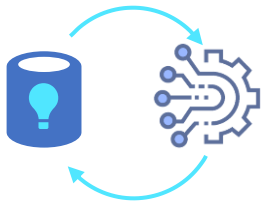

- Reduce costs by providing preventive database maintenance.
- Catastrophic problem prediction through Machine Learning.
- Simplify the database administration and SQL Server farm management.
- Control your SQL Server utilization through centralized portal.
- Get instance access to recommendations.
- Reduce time spent on maintenance and administration.
- View comprehensive BI reports for resource utilization.
- Automate repetitive processes by utilizing APIs.

Artificial Intelligence – Database Administrator

New technology with intelligence over all your SQL Server database management process

Intelligence administration

AI and Machine Learning over all databases with the power of Azure SQL, Python and R

Intelligence performance optimization

200 Resource intensive query optimization within five minutes

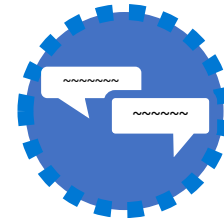

~60% Performance Enhancement with zero code changes

Intelligence over data security

The best of machine learning and abnormal detection on data access and security

Intelligence communication

The first ever system which human can communicate and command to perform task

Extensive knowledgebase

The best of internet search, intelligence summarization and itemization

Ai-DBA

Hero features

Intelligence administration over databases

Preventive maintenance and proactive administration with power of machine learning

Intelligence maintenance window

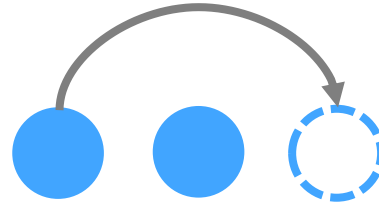

Exact peak and non-peak hours of SQL Server database instance for better maintenance window allocation

Preventive maintenance

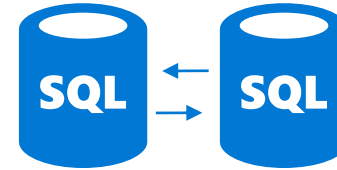

Predict upcoming problems via historical data analyzed in prediction models, and provides workaround instructions and scripts to prevent catastrophic disaster

Proactive administration

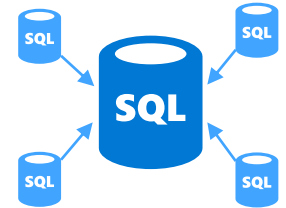

Analyzes the statistical data and provides recommendation base on database workload to get utmost from hardware resources

Intelligence high availability

Analyzes the SQL Server instances within the farm, evaluate and recommend for best high availability solution for existing workload and infrastructure

Intelligence consolidation

Evaluate the database workload and compatibility to recommend consolidation for better use of licenses and hardware resources.

Deployment at your choice

Deployment models with loose components coupling

Challenge

Certain industries are not allowed to use Cloud platform for any purpose.

Solution

The on-premise deployment allows enterprises to enjoy benefits of intelligence solution.

On-Premise

Data repository, report repository and compute engines are reside at customer's premise

On-Cloud

Data repository, report repository and compute engines are located on Azure cloud.

Intelligence performance optimization

Gain performance with no app changes with intelligence query optimization

Challenge

DBA's spend most of their time tuning database performance, leading to high operational costs

Solution

Intelligence performance optimization tasks for mission critical databases

Database structure and indexes analysis

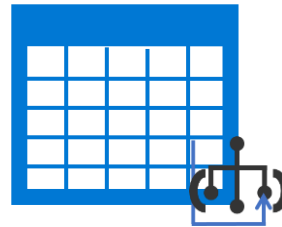

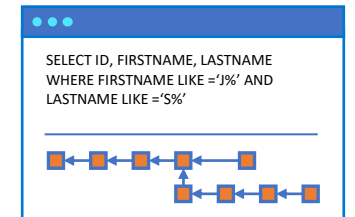

Table and index structures are evaluated based on database workload, configuration and queries

Problematic queries revision

Rewrites the long running queries base on best practices, tables structure and indexes.

Expensive query plan resolution

Alters the existing indexes or create new indexes to reduce the cost of query execution and enhances the performance.

Ai-DBA

You need a system that keeps up your databases with the changing world

The system learns from workload,
predicts catastrophic disasters and
recommends the necessary changes

Intelligence over data security

Prevent data security breach – Always keep a step ahead

Challenge

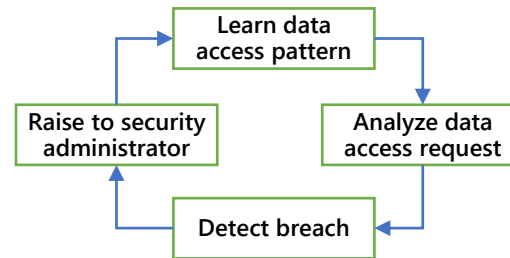

Identifying vulnerabilities and preventing sensitive data leak requires high-cost solutions

Solution

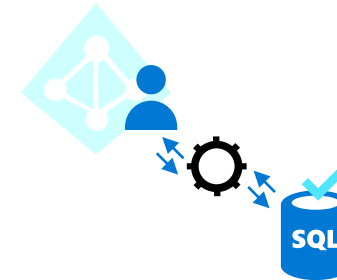

Intelligence features for data classification, access privilege, access pattern analysis and monitoring & alerting

Intelligence abnormal activity detection

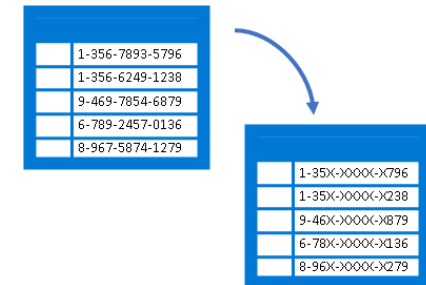

Learns within 3 months and detect abnormalities for existing users within a minute

Active directory synchronization

Synchronizes and validate account session every 30 seconds for linked SQL Server instances

Intelligence data masking

Analyzes and identifies the table columns for data masking based on knowledge base and model

Ai-DBA

Intelligence communication

First ever system to receive command via natural language

Challenge

DBA in charge is on leave or entity does not have in-house DBA, whilst require to perform basic Adhoc tasks

Solution

Intelligence communication enables human and system collaboration via natural language processing.

Note

- * Certain critical commands will not get process such as DROP DATABASE, DROP TABLE, DROP FUNCTION, SHUTDOWN and etc.
- * Certain authorized users will able to communicate with system.

Intelligence e-mail processing

Receive and process natural language via E-mail and communicate with user if further information is needed

Intelligence Machine voice call

Makes a phone call once severe alerts or errors occur to heads-up the system administrator and gets further instructions by IVR

Ai-DBA

Extensive knowledgebase

The best of internet search, intelligence suggestion and self-healing

Challenge

Identifying correct workaround is time consuming and tricky.

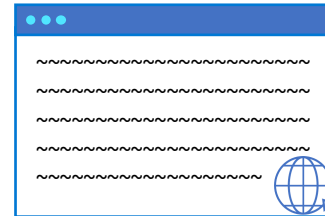

DBA might overlook some underlying errors and warnings.

Solution

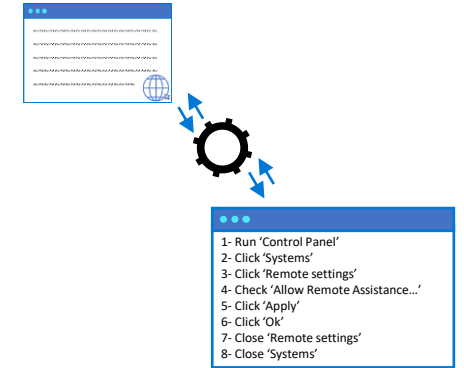

Intelligence features for internet search and self-healing enable the system to identify, search and fix the underneath errors automatically

Intelligence Internet search

Searches internet for a workaround for the errors raised in database or windows server. The web page content is evaluated to assign the relevancy level with the error

Intelligence self-healing

Summarizes and itemize the web page content, the generated action steps are fed to agent service to apply the workaround automatically

Leverage on Ai to gain fabulous enhancement

Free Support and Assurance

Get the best support and advice with zero additional charges

Support or advisory Ticket

We provide support or advisory for purchased subscriptions within 24 hours

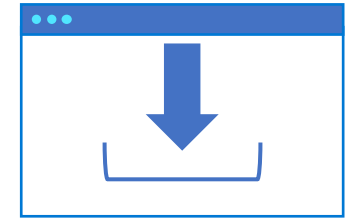

The support is in English language.

Connect with expert engineers

Connect with expert engineers offer unprecedented expertise and education on Ai-DBA product. Our engineers openly sharing information with a goal of improving the user experience and product functionalities.

Receive hotfixes

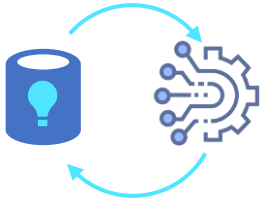

The hotfix is built by developers and applied to identical environment or all existing Ai-DBA services. Hotfixes are tested at engineering lab environment prior release to production.

Achievement Unlocked

You can trust Ai-DBA to do the job for you.

Intelligence administration

2500 databases are managed on daily basis

846 Catastrophic issues predicted and mitigated

6 SQL Server farms evaluated for consolidation

23 Pairs of SQL Server instances evaluated for high availability

Choice of target SQL Server

2500 databases are involved

85% Mission critical databases

15% Cloud hosted

Intelligence performance optimization

186,000 resource intensive queries tuned

Average **55%** performance improvement per database

Insights over data security

1,075,000 data access pattern learnt

35,000 abnormal data access identified and alerted
